

WEB-BASED TOOLS FOR DATA ANALYSIS: JUPYTERLAB ENVIRONMENT AND WORKFLOW OPTIMIZATION

Miguel Portela

October 2021

The following material is available on **GitHub**

https://github.com/reisportela/R_Training

1. Operating system

- Linux (e.g., Ubuntu 20.04), OSX Catalina, Windows 10

2. Packages

Windows: consider installing [Chocolatey](#), a package manager for Windows (similar to `yum` in CentOS or `brew` in OSX)

- Python: install Anaconda – <https://www.anaconda.com>

Example, using Chocolatey: `choco install anaconda3`

or download and install

- **R:** <https://www.r-project.org>
- **Julia:** <https://julialang.org>
- **Stata:** <https://www.stata.com>

Recomendation: install [RStudio](#)

3. Jupyter

“The Jupyter Notebook is an open-source web application that allows you to **create and share** documents that contain *live code*, equations, visualizations and **narrative text**. Uses include: data cleaning and transformation, numerical simulation, statistical modeling, data visualization, machine learning, and much more.”

3.1 Install [jupyter](#)

- Open a Terminal in either Linux or OSX
- Open Windows Powershell as Administrator

Run the following lines

- **jupyter notebook:** *pip install notebook* **or** *conda install -c conda-forge notebook*
- **jupyter lab:** *pip install jupyterlab* **or** *conda install -c conda-forge jupyterlab*

3.2 Install your [kernels](#)

- **Python:** this should be the first one installed [ipykernel](#)
- **R:** [irkernel](#)

Open an R console, e.g. within RStudio, and execute sequentially, *install.packages('IRkernel'), IRkernel::installspec()*

Add `Node.js` and `npm`

Visit [Nodejs.org](#) to **install** `Node.js` and `npm`

- **Julia:** [IJulia](#)

Run Julia and execute sequentially, *using Pkg, Pkg.add("IJulia")*

- **Stata:** [stata_kernel](#)

for Stata see the instructions by [Kyle Barron](#)

[Magics](#) – “Magics are programs provided by `stata_kernel` that enhance the experience of working with Stata in Jupyter.”

3.3 Start ‘notebook’ or ‘lab’

Open a Terminal/Power shell, move to your working folder and type:

- **jupyter notebook:** *jupyter notebook*
- **jupyter lab:** *jupyter lab*

It should open your browser with the notebook and the installed kernels.

3.4 Remove a Kernel

```
jupyter kernelspec list
```

```
jupyter kernelspec uninstall unwanted-kernel
```

4. [Binder](#)

[Running R Projects in MyBinder: Dockerfile Creation With Holepunch](#)

- myBinder
- Gesis Notebooks

Check the following link

[Configuration Files](#)

mybinder allows you to create a linked icon to your interactive notebook

Check the example in GitHub with RStudio & R 3.6 + Python + Julia + Stata

[reisportela/prjs](#)

- or a setup where we can build a notebook with Python 3.0 or R (you can also run RStudio from this link)

Even better, use [GESIS notebooks](#) to launch your image

The concept using GESIS

MyBinder: [EXAMPLES](#)

5. A gallery of interesting Jupyter Notebooks

- [Gallery](#)
- [Plotting and Programming in Python](#)
- [Exploratory data analysis in Python](#)

6. Books

- [Python Data Science Handbook](#)
- [Bookdown](#)
- [How to Hide all the code cells in Jupyter Notebook Python with single Click](#)

7. Checks

- [Binder Multi-language demo](#)
- [mybinder.io](#)

8. SoS NOTEBOOK

- [Local installation](#)

pip installation

```
pip3 install sos
```

```
pip3 install sos-pbs
```

```
pip3 install sos-notebook
```

```
pip3 install sos-papermill
```

```
pip3 install sos-r
```

```
pip3 install sos-julia
```

```
pip3 install sos-stata
```

```
python3 -m sos_notebook.install
```

```
jupyter kernelspec list
```

```
jupyter notebook
```

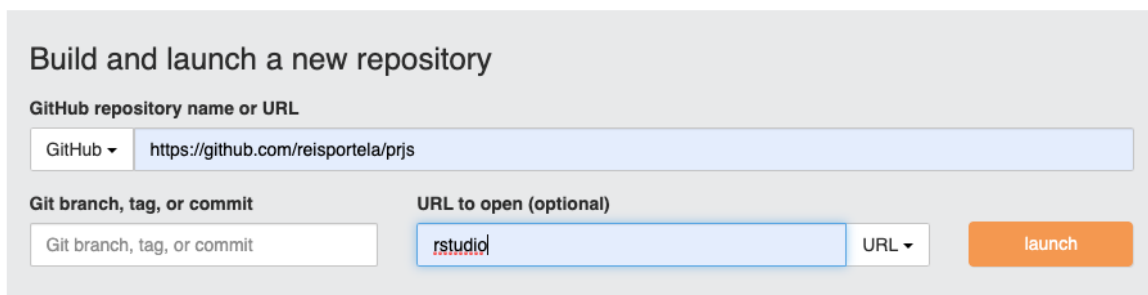

9. Discussion on Julia

- use an environment [julia-python](#)
- a [multi-language-demo](#)
- [Using Julia in Binder: interactive web environment for running your code](#)

By default I will not activate a machine running Python, R and Julia as it takes too long to build the image. I recomend using the [link](#).

10. GESIS Notebooks

- Create a login in GESIS Notebooks and add your machine (running RStudio)

The screenshot shows a web form titled "Build and launch a new repository". It has two main sections. The first section, "GitHub repository name or URL", contains a dropdown menu set to "GitHub" and a text input field with the URL "https://github.com/reisportela/prjs". The second section, "Git branch, tag, or commit", has a text input field with the placeholder "Git branch, tag, or commit". To its right, under the heading "URL to open (optional)", there is a text input field containing "rstudio", a dropdown menu set to "URL", and an orange "launch" button.

or a **Jupyter Lab**

GitHub repository name or URL

GitHub ▾

Git ref (branch, tag, or commit) URL to open (optional) URL ▾

Copy the URL below and share your Binder with others:

11. Further notes

11.1 Jupyter's extensions

conda install -c conda-forge jupyter_contrib_nbextensions

jupyter contrib nbextension install --user

11.2 Kaggle Kernels

[Kaggle](#)

11.3

[How to Hide all the code cells in Jupyter Notebook Python with single Click](#)

11.4 Pandas

[Pandas cookbook](#)

R and Dropbox

[rdrop2](#)

12. Usefull links

[Binder](#)

[CODE OCEAN](#)

[GESIS Notebooks](#)

[Hypernet Labs](#)

[IBM Skills Network Lab](#)

[RStudio Cloud](#)
