A simple example using Markdown

Paulo Guimaraes and Miguel Portela

23 January 2020

Working with text

Markdown is very easy to use. You can write in *italics* or in **bold**. You can even ~~strikeout~~

It is very easy to make headers

Sub header

some text

Lower level

and more text

Blocking text

> This is how blocked text looks like

Introducing a link

If you click on *Stata Winter School* it will send you to the website

Introducing an image

This is how you had an image. The image can be read from your computer or even

from the internet

Making lists is simple

- Item 1
  - Item 11
  - Item 12
- Item 2

or even numeric lists

1. This is item1

2. This is item2

3. This is item3

An here is a simple table

	col1	col2
row1	1	4
row2	2	3

Writing in Latex

If you have $LaTeX$ installed you can write $LaTeX$ expressions directly. All you need is to enclose the code in $ signs. Here is an expression written inline $a^2 + b^2 = c^2$. And this is how you write a display equation[1]

$$a^2 + b^2 = c^2$$

---

[1]But you must have $LaTeX$ installed.

Adding HTML

Markdown will recognize raw HTML code.

Emphasizing a line using HTML
